

## **ABSTRACT OF THE DISCLOSURE**

The present invention is scissors with precise control and labor-saving functions. It is to accurately control shears and cooperate with extendable force-arms with double fulcrums to save labor. The present invention comprises: a pair of cutting portions with a pair of cutters, the cutters being connected pivotally; two handle portions having two handle rods with double fulcrums and interaction force-arms, the double fulcrums including two front fulcrums connecting and exactly controlling the cutting portions and two rear fulcrums pivotally located on two rear ends of two handle rods, the rear fulcrums cooperating with an elastic member to let the handle rods restore; two sliding sleeves located on the handle portions and being extendable based on length demands to assist as handle rods. Therefore, the shears can be controlled easily and precisely.
